

# Stable Matching → Marriage

2 sides to the market place

① Stability  
- No (student, school) pair wants to abandon their existing partner for each other

② Strategy proof

Claim:  $\exists$  algorithm called "Deferred Acceptance" that

- ① results in a stable matching
- ② strategy proof for one <sup>"proposer"</sup> side.
- ③ among stable matchings, the algorithm gives the one that is "best" for the same side for which it is strategy proof

## Algorithm

Do the following until done:

Loop through students who are not "currently" matched:

- Student applies to favorite school that has not rejected them yet.  
school: if that student is "more-preferred" than school's "current match," then reject current

match and accept  
new students.

else reject new applicant

Done condition:

- ⊖ all students matched
- all non matched students have been rejected everywhere.

ABC (1) — (A) 123

ABC (2) ~~— (B) 312~~

ABC (3) ~~— (C) 321~~

- 
- Easier to apply as a couple  $\ll$

Impossible to separate the math from the politics

Can you "prioritize" rural hospitals?

No. in every stable matching the same spots ("rural hospitals") are left unmatched.

① docs empirically rank rural hospitals low

② hospitals empirically rank immigrant docs low

did med school  
outside of US.

## Boston Mechanism

ABC (1) ——— (A) 123

~~ABC~~ (2) - - - (B) 312  
BAC

~~ABC~~ (3) - - - (C) 321

① look at every student's favorite school

- give the students their favorite if it's open

② look at everyone's 2nd favorite

- give it to them
